

SM100

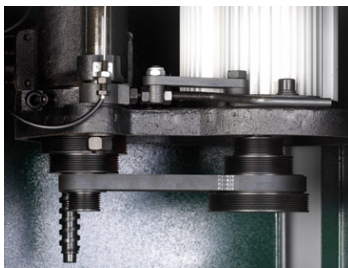

Optional Sliding Table

A sliding table is essential for most end grain work and makes the machine even more versatile. It can be easily removed when along the grain work is being carried out.

Suva Safety Guards

This intelligently designed system vastly reduces the risk of the work piece travelling upwards or outwards, ensuring the quality of cut as well as protecting the user. These must be used when a feed unit is not fitted and this design with its top pressure wheels makes for a smoother feel to the feed.

Powerful Motor

The large 3.5hp motor provides an abundance of power and can handle thick stock with ease.

Safety Fence Available

The optional safety fence is an extremely worthwhile addition to the SM100. Everything but the cutter can be covered, therefore eliminating the possibility of the material being pulled between the fences. They remove the need for false fences being made for a particular job and afford the operator exceptional safety.

Four Speeds

The machine has four speeds to cope with different diameters and types of tooling, as well as sanding if needed. For safety, indicator lights confirm which speed the machine is set on.

Spindle Height Readout

An accurate gauge shows the precise height of the spindle to help ensure the perfect profile is achieved.
